## NEW PYRIMIDINE COMPOUNDS

### Field of the Invention

5 The present invention relates to new compounds of the formula I, as a free base or a pharmaceutically acceptable salt thereof, process for their preparation, pharmaceutical formulations containing said compounds and to the use of said active compounds in therapy.

10 An object of the invention is to provide compounds of formula I for therapeutic use, especially compounds that are useful for the treatment and/or prophylaxis of conditions associated with glycogen synthase kinase-3 (GSK3) in mammals including man. Particularly compounds of formula I exhibiting a selective affinity for GSK-3.

15 It is also an object of the invention to provide compounds with a therapeutic effect after oral administration.

### Background of the invention

20 Glycogen synthase kinase 3 (GSK3) is a serine / threonine protein kinase composed of two isoforms ( $\alpha$  and  $\beta$ ), which are encoded by distinct genes but are highly homologous within the catalytic domain. GSK3 is highly expressed in the central and peripheral nervous system. GSK3 phosphorylates several substrates including tau,  $\beta$ -catenin, glycogen  
25 synthase, pyruvate dehydrogenase and elongation initiation factor 2b (eIF2b). Insulin and growth factors activate protein kinase B, which phosphorylates GSK3 on serine 9 residue and inactivates it.

*Alzheimer's Disease (AD) dementias, and tauopathies.*

30 AD is characterized by cognitive decline, cholinergic dysfunction and neuronal death, neurofibrillary tangles and senile plaques consisting of amyloid- $\beta$  deposits. The sequence of these events in AD is unclear, but believed to be related. Glycogen synthase kinase 3 $\beta$

(GSK3 $\beta$ ) or Tau ( $\tau$ ) phosphorylating kinase selectively phosphorylates the microtubule associated protein  $\tau$  in neurons at sites that are hyperphosphorylated in AD brains. Hyperphosphorylated protein  $\tau$  has lower affinity for microtubules and accumulates as paired helical filaments, which is the main component that constitute neurofibrillary tangles and neuropil threads in AD brains. This results in depolymerization of microtubules, which leads to dying back of axons and neuritic dystrophy. Neurofibrillary tangles are consistently found in diseases such as AD, amyotrophic lateral sclerosis, parkinsonism-dementia of Guam, corticobasal degeneration, dementia pugilistica and head trauma, Down's syndrome, postencephalatic parkinsonism, progressive supranuclear palsy, Niemann-Pick's Disease and Pick's Disease. Addition of amyloid- $\beta$  to primary hippocampal cultures results in hyperphosphorylation of  $\tau$  and a paired helical filaments-like state via induction of GSK3 $\beta$  activity, followed by disruption of axonal transport and neuronal death (Imahori and Uchida., J. Biochem 121:179-188, 1997). GSK3 $\beta$  preferentially labels neurofibrillary tangles and has been shown to be active in pre-tangle neurons in AD brains. GSK3 protein levels are also increased by 50% in brain tissue from AD patients. Furthermore, GSK3 $\beta$  phosphorylates pyruvate dehydrogenase, a key enzyme in the glycolytic pathway and prevents the conversion of pyruvate to acetyl-Co-A (Hoshi et al., PNAS 93:2719-2723, 1996). Acetyl-Co-A is critical for the synthesis of acetylcholine, a neurotransmitter with cognitive functions. Thus, GSK3 $\beta$  inhibition may have beneficial effects in progression as well as the cognitive deficits associated with Alzheimer's disease and other above-referred to diseases.

#### *Chronic and Acute Neurodegenerative Diseases.*

Growth factor mediated activation of the PI3K /Akt pathway has been shown to play a key role in neuronal survival. The activation of this pathway results in GSK3 $\beta$  inhibition. Recent studies (Bhat et. al., PNAS 97:11074-11079 (2000)) indicate that GSK3 $\beta$  activity is increased in cellular and animal models of neurodegeneration such as cerebral ischemia or after growth factor deprivation. For example, the active site phosphorylation was increased in neurons vulnerable to apoptosis, a type of cell death commonly thought to occur in chronic and acute degenerative diseases such as Alzheimer's Disease, Parkinson's Disease, amyotrophic lateral sclerosis, Huntington's Disease and HIV dementia, ischemic stroke and head trauma. Lithium was neuroprotective in inhibiting apoptosis in cells and in the

brain at doses that resulted in the inhibition of GSK3 $\beta$ . Thus GSK3 $\beta$  inhibitors could be useful in attenuating the course of neurodegenerative diseases.

#### *Bipolar Disorders (BD)*

5 Bipolar Disorders are characterised by manic episodes and depressive episodes. Lithium has been used to treat BD based on its mood stabilising effects. The disadvantage of lithium is the narrow therapeutic window and the danger of overdosing that can lead to lithium intoxication. The recent discovery that lithium inhibits GSK3 at therapeutic concentrations has raised the possibility that this enzyme represents a key target of  
10 lithium's action in the brain (Stambolic et al., Curr. Biol. 6:1664-1668, 1996; Klein and Melton; PNAS 93:8455-8459, 1996). Inhibition of GSK3 $\beta$  may therefore be of therapeutic relevance in the treatment of BD as well as in AD patients that have affective disorders.

#### *Schizophrenia*

15 GSK3 is involved in signal transduction cascades of multiple cellular processes, particularly during neural development. Kozlovsky et al (Am J Psychiatry 2000 May;157(5):831-3) found that GSK3 $\beta$  levels were 41% lower in the schizophrenic patients than in comparison subjects. This study indicates that schizophrenia involves neurodevelopmental pathology and that abnormal GSK3 regulation could play a role in  
20 schizophrenia. Furthermore, reduced  $\beta$ -catenin levels have been reported in patients exhibiting schizophrenia (Cotter et al., Neuroreport 9:1379-1383 (1998)).

#### *Diabetes*

Insulin stimulates glycogen synthesis in skeletal muscles via the dephosphorylation and  
25 thus activation of glycogen synthase via dephosphorylation. Under resting conditions, GSK3 phosphorylates and inactivates glycogen synthase. GSK3 is also over-expressed in muscles from Type II diabetic patients (Nikoulina et al., Diabetes 2000 Feb;49(2):263-71). Inhibition of GSK3 increases the activity of glycogen synthase thereby decreasing glucose levels by its conversion to glycogen. GSK3 inhibition may therefore be of therapeutic  
30 relevance in the treatment of Type I and Type II diabetes and diabetic neuropathy.

*Hair Loss*

GSK3 phosphorylates and degrades  $\beta$ -catenin.  $\beta$ -catenin is an effector of the pathway for keratin synthesis.  $\beta$ -catenin stabilisation may lead to increase hair development. Mice expressing a stabilised  $\beta$ -catenin by mutation of sites phosphorylated by GSK3 undergo a process resembling de novo hair morphogenesis (Gat et al., Cell 1998 Nov 25;95 (5):605-14)). The new follicles formed sebaceous glands and dermal papilla, normally established only in embryogenesis. Thus GSK3 inhibition may offer treatment for baldness.

*Oral contraceptives*

Vijayaraghavan et al. (Biol Reprod 2000 Jun; 62 (6):1647-54) reported that GSK3 is high in motile versus immotile sperm. Immunocytochemistry revealed that GSK3 is present in the flagellum and the anterior portion of the sperm head. These data suggest that GSK3 could be a key element underlying motility initiation in the epididymis and regulation of mature sperm function. Inhibitors of GSK3 could be useful as contraceptives for males.

Listed below are definitions of various terms used in the specification and claims to describe the present invention.

20 For the avoidance of doubt it is to be understood that where in this specification a group is qualified by 'hereinbefore defined' or 'defined hereinbefore' the said group encompasses the first occurring and broadest definition as well as each and all of the preferred definitions for that group.

25 For the avoidance of doubt it is to be understood that in this specification 'C<sub>1-6</sub>' means a carbon group having 1, 2, 3, 4, 5 or 6 carbon atoms.

In this specification the term "alkyl" includes both straight and branched chain alkyl groups. The term C<sub>1</sub>-C<sub>6</sub> alkyl having 1 to 6 carbon atoms and may be methyl, ethyl, n-propyl, i-propyl, n-butyl, i-butyl, s-butyl, t-butyl, n-pentyl, i-pentyl, t-pentyl, neo-pentyl,  
30 n-hexyl or i-hexyl. The term C<sub>1</sub>-C<sub>3</sub> alkyl having 1 to 3 carbon atoms and may be methyl, ethyl, n-propyl or i-propyl. The term C<sub>1</sub>-C<sub>2</sub> alkyl having 1 to 2 carbon atoms and may be methyl or ethyl.

A similar definition applies to other radicals, for example "phenylC<sub>1-6</sub>alkyl" includes phenylC<sub>1-4</sub>alkyl, 1-phenylethyl and 2-phenylethyl.

5 In the case where a subscript is the integer 0 (zero) the group to which the subscript refers to indicates that the group may be absent, i.e. there is a direct bond between the groups, for example in the definition of X which is C<sub>0-6</sub>alkyl-U-C<sub>0-6</sub>alkyl the subscript may be 0 (zero) which means that X=U.

10 The term "cycloalkyl" refers to an optionally substituted, saturated cyclic hydrocarbon ring system. The term "C<sub>3-6</sub>cycloalkyl" may be cyclopropyl, cyclobutyl, cyclopentyl or cyclohexyl.

The term "alkenyl" refers to a straight or branched chain alkenyl group. The term C<sub>2</sub>-C<sub>6</sub>  
15 alkenyl having 2 to 6 carbon atoms and one double bond, and may be vinyl, allyl, n-propenyl, i-propenyl, n-butenyl, i-butenyl, crotyl, pentenyl, i-pentenyl or hexenyl. The term C<sub>2</sub>-C<sub>3</sub> alkenyl having 2 to 3 carbon atoms and one or two double bond, and may be vinyl, allyl, propenyl or i-propenyl.

20 The term "alkynyl" refers to a straight or branched chain alkynyl group. The term C<sub>2</sub>-C<sub>6</sub> alkynyl having 2 to 6 carbon atoms and one trippel bond, and may be etynyl, propargyl, n-butynyl, i-butynyl, n-pentynyl, i-pentynyl or hexynyl. The term C<sub>2</sub>-C<sub>3</sub> alkynyl having 2 to 3 carbon atoms and one trippel bond, and may be etenyl or propargyl.

25 The term "C<sub>1-3</sub>alkoxy" may be straight or branched and may be methoxy, ethoxy, n-propoxy or i-propoxy.

The term "halo" refers to fluoro, chloro, bromo and iodo.

30 The term "aromatic group" refers to an optionally substituted monocyclic or bicyclic hydrocarbon ring system containing at least one unsaturated aromatic ring. The "aromatic group" may be fused with a C<sub>5</sub>-C<sub>7</sub> cycloalkyl ring to form a bicyclic hydrocarbon ring

system. Suitable examples of the term "aromatic group" are phenyl, naphthyl, indanyl and tetralinyl.

The term 5- or 6- membered heteroaromatic ring containing one, two or three heteroatoms selected from N, O and S may be furyl, imidazolyl, isoxazolyl, isothiazolyl, oxazolyl, pyrazinyl, pyrazolyl, pyridazinyl, pyridyl, pyrimidyl, pyrrolyl, thiazolyl or thienyl.

The term "heterocyclic group" refers to a saturated, partially saturated or unsaturated, mono or bicyclic ring containing 4 to 12 atoms of which at least one heteroatom is chosen from N, S or O, which may, unless otherwise specified, be carbon or nitrogen linked, wherein a CH<sub>2</sub> group can optionally be replaced by a CO, a ring nitrogen atom may optionally bear a C<sub>1-6</sub>alkyl group and form a quaternary compound or a ring nitrogen and/or sulphur atom may be optionally oxidised to form the *N*-oxide, sulfoxide and/or sulfone. Suitable examples of the term "heterocyclic group" are morpholinyl, piperidyl, pyridyl, pyranal, pyrrolyl, isothiazolyl, indolyl, quinolyl, thienyl, 1,3-benzodioxolyl, thiadiazolyl, piperazinyl, thiazolidinyl, pyrrolidinyl, thiomorpholino, pyrrolinyl, homopiperazinyl, 3,5-dioxapiperidinyl, tetrahydropyranyl, imidazolyl, pyrimidyl, pyrazinyl, pyridazinyl, isoxazolyl, *N*-methylpyrrolyl, 4-pyridone, 1-isoquinolone, 2-pyrrolidone, 4-thiazolidone, pyridine-*N*-oxide and quinoline-*N*-oxide. Particular a "heterocyclic group" is a saturated, partially saturated or unsaturated, mono or bicyclic ring containing 5 or 6 atoms of which at least one heteroatom is chosen from nitrogen, sulphur or oxygen, which may, unless otherwise specified, be carbon or nitrogen linked, wherein a CH<sub>2</sub> group can optionally be replaced by a C(O), a ring nitrogen atom may optionally bear a C<sub>1-6</sub>alkyl group and form a quaternary compound or a ring nitrogen and/or sulphur atom may be optionally oxidised to form the *N*-oxide and/or sulfoxide or sulfone.

It will be appreciated that certain of the various ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately 25 following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of

aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halogeno group. Particular examples of modifications include the reduction of a nitro group to an amino group by for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl. It will also be appreciated that in some of the reactions mentioned herein it may be necessary/desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable, suitable methods for protection are known to those skilled in the art. Conventional protecting groups may be used in accordance with standard practice (for illustration see T.W. Green, P.G.M. Wutz, Protective Groups in Organic Synthesis, Wiley Interscience, 1999). The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

In addition to their use in therapeutic medicine, the compounds of formula I as a free base or a pharmaceutically acceptable salt thereof are also useful as pharmacological tools in the development and standardisation of *in vitro* and *in vivo* test systems for the evaluation of the effects of inhibitors of GSK3 related activity in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutical agents.

### Pharmacology

#### *Determination of ATP competition in Scintillation Proximity GSK3 $\beta$ Assay*

15

##### *GSK3 $\beta$ scintillation proximity assay.*

The competition experiments were carried out in duplicate with 10 different concentrations of the inhibitors in clear-bottom microtiter plates (Wallac, Finland). A biotinylated peptide substrate, Biotin-Ala-Ala-Glu-Glu-Leu-Asp-Ser-Arg-Ala-Gly-Ser(PO<sub>3</sub>H<sub>2</sub>)-Pro-Gln-Leu (AstraZeneca, Lund), was added at a final concentration of 1  $\mu$ M in an assay buffer containing 1 mU recombinant human GSK3 $\beta$  (Dundee University, UK), 12 mM morpholinepropanesulfonic acid (MOPS), pH 7.0, 0.3 mM EDTA, 0.01 %  $\beta$ -mercaptoethanol, 0.004% Brij 35 (a natural detergent), 0.5 % glycerol and 0.5  $\mu$ g BSA/25  $\mu$ l. The reaction was initiated by the addition of 0.04  $\mu$ Ci [ $\gamma$ -<sup>33</sup>P]ATP (Amersham, UK) and unlabelled ATP at a final concentration of 1  $\mu$ M and assay volume of 25  $\mu$ l. After incubation for 20 minutes at room temperature, each reaction was terminated by the addition of 25  $\mu$ l stop solution containing 5 mM EDTA, 50  $\mu$ M ATP, 0.1% Triton X-100 and 0.25 mg streptavidin coated Scintillation Proximity Assay (SPA) beads (Amersham, UK). After 6 hours the radioactivity was determined in a liquid scintillation counter (1450 MicroBeta Trilux, Wallac). The inhibition curves were analysed by non-linear regression using GraphPad Prism, USA. The K<sub>m</sub> value of ATP for GSK3 $\beta$ , used to calculate the inhibition constants (K<sub>i</sub>) of the various compounds, was 20  $\mu$ M.
